OFFER

The company UPRUC POL SA FAGARAS is specialized on the execution of the tanks with a capacity between 50-150.000 liters.

"Polstif" stratifications are achieved by fitting with synthetic resins with fiberglass according to certain production technologies. Products obtained have a good chemical resistance and mechanical strength comparable to that of similar products from steel, for a weight of about 4 times smaller.

The stratifications characteristics achieved in production of POLSTIF products make possible the utilization in various fields:

-CONSTRUCTIONS - storage tanks for water supply from drilling, booth of drilling boreholes, , home for water meters, basin catchment for rainwater, basins for septic tanks, basin for water reserve in the event of fire, basin for water treatment, industrial water tanks and unionized water tanks , transport cisterns and delivery water cisterns

-CHEMICAL INDUSTRY – tanks and cisterns for storage and transportation of chemicals products in the form of powders, liquids, pasta powders, tanks for fuel in categories III and IV reactors (including stirring system), ventilation pipe, pickling tunnels, galvanizing, column-type machines for various applications in the field of environmental protection (e.g. gas Washings)

-FOOD INDUSTRY – tanks for storage and transportation tanks for milk and milk products, fats and oils, spirits, fruit juices, vinegar, pickles, etc.

-AGRICULTURE – tanks for herbicides plants, silos for grain and feed, cisterns for water transportation on the irrigation

The products are:

A. Tanks

UNDERGROUND TANKS have the advantage of installing simple, no other rearranges, in very short time and without building site preparation

This version does not require isolation, capacities 1000 -150000 liters and for larger volumes can be used tanks tied in a series.

OVERGROUND TANKS

Depending on the needs you can use **vertical tanks (with flat-bottom or supports) and horizontal tanks**

Horizontal overground tanks are mounted on steel or Polstif saddles, if necessary, delivered with the tank

Vertical Overground Tanks are mounted either directly on the concrete foundation or on the metal legs of your choice

B. Equipments for treating wastewater

Our company makes the base components for disposal and waste water treatment: septic TANKS, septic INHOFF, sand and oil separators, waste water treatment stations

C. Cisterns used to transport various materials can be ellipsoidal or cylinder section. May have one or more compartments and the mounting is established in each case.

D. Silos

The maximum capacity for a single silo is 175 mc, the diameter up to 4 m inclusive. You can store liquid and powder materials (PVC, PE, granules etc)

E. Sticoplast parts

Sticoplast antifriiction parts are for example: bushings, bearings, rings, skates, spherical bushings and are made for sliding bearings. These pieces are made of composite plastics, with and without carbon steel metal underlayers. The structure of the material, for example, wall pieces, consist of an antifriiction layer followed by fiber-reinforced laminated glass of the proper thickness.
